# **Introduction**

## **1.1 LTFP Tools purpose and link to FCCL Framework**

### **1. Introduction**

#### *1.1 Purpose of the Manual*

The Cross River State Long-Term Fiscal Planning Tool (the LTFP Tool or Tool) is an Excel-based tool developed to assist in the identification, assessment, and monitoring of the Fiscal Commitments and Contingent Liabilities (FCCL) arising from public-private partnership (PPP) projects. This document serves as a draft manual (the LTFP Manual or Manual) to guide the users of the LTFP Tool.

The identification, assessment, and monitoring of FCCL are to be conducted according to the FCCL guidelines and methodology for FCCL management (the FCCL Framework) proposed by the Cross River State Government. It is, therefore, critical that users of the LTFP Tool and this Manual are familiar with the guidelines developed in the FCCL Framework and have adopted the FCCL Framework for the identification and management of FCCL.

The FCCL Framework provides a detailed description of fiscal liabilities arising from PPP contracts as per the FCCL Guidelines and the methodology for identifying and assessing fiscal risks and associated contingent liabilities (CL) according to the Technical Guidance within the framework. A thorough understanding of these concepts is essential before using the LTFP Tool.

The Tool has been developed to provide practical templates for assessing project risks and calculating direct fiscal commitments (FC) and typical CL in PPP schemes. It is intended to be used in alignment with the FCCL Framework.

This Tool is primarily designed for the Debt Management Department (DMD) within the Cross River State Ministry of Finance (DMD-MOF). The DMD is responsible for overseeing and reporting on FCCLs, particularly those arising from PPPs. However, the DMD's ability to utilize the tool effectively will depend on inputs of project assumptions provided by the Contracting Authority (CA) or the Bureau of Public Private Partnership (BPPP).

### **1.2 LTFP Tool Layout**

The Long-Term Fiscal Planning Tool (LTFP Tool) is structured to process inputs from specific PPP projects. It enables the calculation of Fiscal Commitments and Contingent Liabilities (FCCLs) at the project level and provides an aggregated overview of the state's total commitments and liabilities.

The Tool integrates assumptions based on Cross River State's projected macroeconomic indicators, including Gross Domestic Product (GDP), debt, revenues, and expenditures. These assumptions serve as a baseline for evaluating the Fiscal Commitments (FC) and Contingent Liabilities (CL) associated with individual projects and assessing their cumulative impact at the state level. This structure ensures a comprehensive fiscal planning and risk management approach for PPP projects.

The LTFP Tool is structured to incorporate inputs from specific projects, calculate the FCCLs per project, and provide an aggregate picture of state-level commitments and liabilities.

The LTFP tool also integrates assumptions for CRSG's projected macroeconomic parameters, such as Gross Domestic Product (GDP), debt, revenues, and expenditures, against which the FC and CL are assessed at both the project and state levels.

Figure 0-1 Presents the FCCL assessment structure within the Tool.

**Figure 0-1: FCCL assessment structure**

Subsequent sections present each of the Tool's components. The Tool is an Excel-based workbook organized according to the following Excel worksheets.

**Table 0-1: Summary of the worksheets included in the model**

Sheet Name	Component	Description
Cover Sheet	Disclaimer	Contains important disclaimers regarding the use of the Tool.
Notes to Users	Guidance on how to use the Tool	This section provides step-by-step instructions for populating project data, calculating FCCL based on Monte Carlo simulations, and updating consolidated dashboards.
Dashboard Totals	Consolidated Assessments	It provides tables and graphical summaries of FCCL on an NPV basis and compares them with Cross River State's macro-economic data in the year of assessment.
Dashboard Annual	Consolidated Assessments	It provides tables and graphical summaries of FCCL and compares them with Cross River State's macroeconomic data on an annual basis.
CRSG MacroEco	Macro-Economic Inputs	This provides Cross River State's macroeconomic assumptions, including GDP, debt, revenues, expenditures, inflation, and the NGN exchange rate.
Monte Carlo Simulations	Monte Carlo Simulations Inputs and Outputs	A sheet for calculating revenue, volume, and foreign exchange rate profiles using a Monte Carlo simulation approach.
P1-Risk	Project 1 Overview and Fiscal Risks Identification	Includes Project 1's name, sector, and type, as well as its Risk Matrix and Register by FCCL guidelines.
P1-FCCL	Project 1 FCCL Assessments	Includes Project 1's FCCL calculation based on assumptions entered the same sheet.
P2-Risk	Project 2 Overview and Fiscal Risks Identification	Includes Project 2's name, sector, and type, as well as its Risk Matrix and Register by FCCL guidelines.
P2-FCCL	Project 2 FCCL Assessments	Includes Project 2's FCCL calculation based on assumptions entered in the same sheet.
P#-Risk	Project # Overview and Fiscal Risks Identification	It includes the project #'s name, sector, and type, as well as its risk matrix and registers under FCCL guidelines.
P-FCCL	Project # FCCL Assessments	This includes the Project's FCCL calculation based on assumptions entered into the same sheet.

### 1.3 LFTP Data base

The Tool incorporates information on three projects currently in the Cross River State Government (CRSG) PPP project pipeline (refer to Section 1.1.1 of the FCCL Framework), plus one example of an accommodation PPP. However, these projects are at an early stage of preparation, and the FCCL impact has not yet been identified or quantified by the BPPP. Instead of actual project information, sample

financial data have been used in the FCCL assessment worksheet based on the type of project. This data would need to be updated by CRSG once the Outline Business Case (OBC) for the projects is prepared. A purely theoretical PPP accommodation example has been added as P5 as a demonstration.

## 1.4 Overall Guideline for the use of Tools

### 1.4.1 Cell Coding

The following is the cell coding across the various sheets.

- **Input cells:**

All input cells allow numeric inputs and are in orange colour. The users should input data in these cells as per guidance of the indicated units (date, amounts or %) in the adjacent cell.

Don't input values in units other than indicated in the adjacent cell as this would result in errors.

- All **Yes or No** cell are equipped with a scroll down function:

- **Computed cells:**

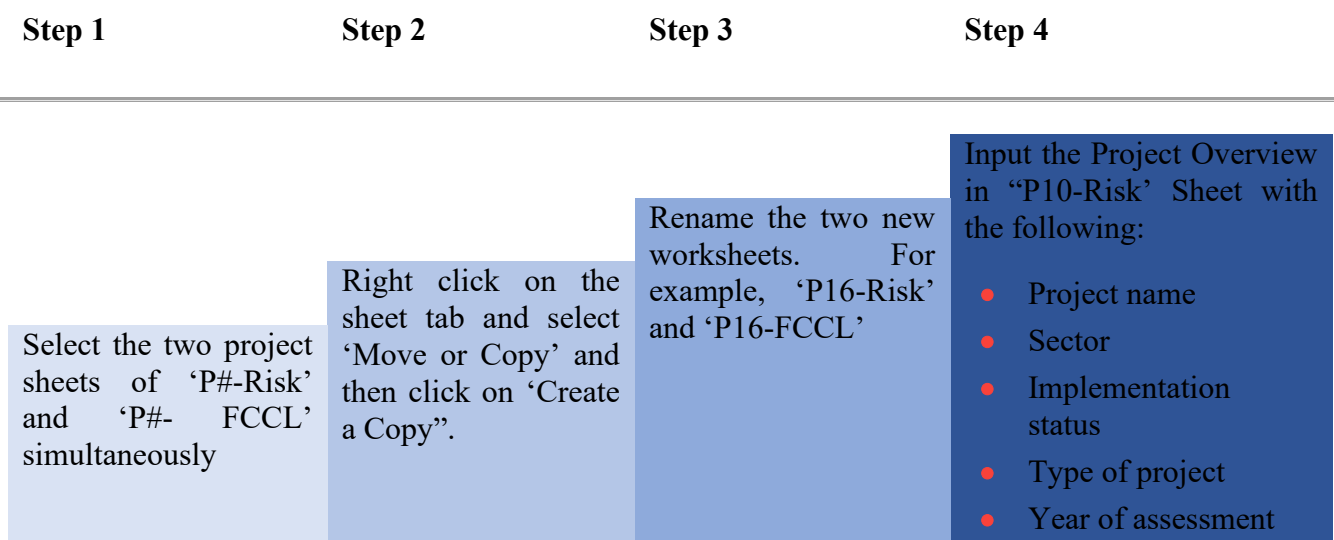

All pre-programmed computed cells are in grey colour. These should not be modified by the user.

Don't input values in pre-programmed cells as this would result in errors.

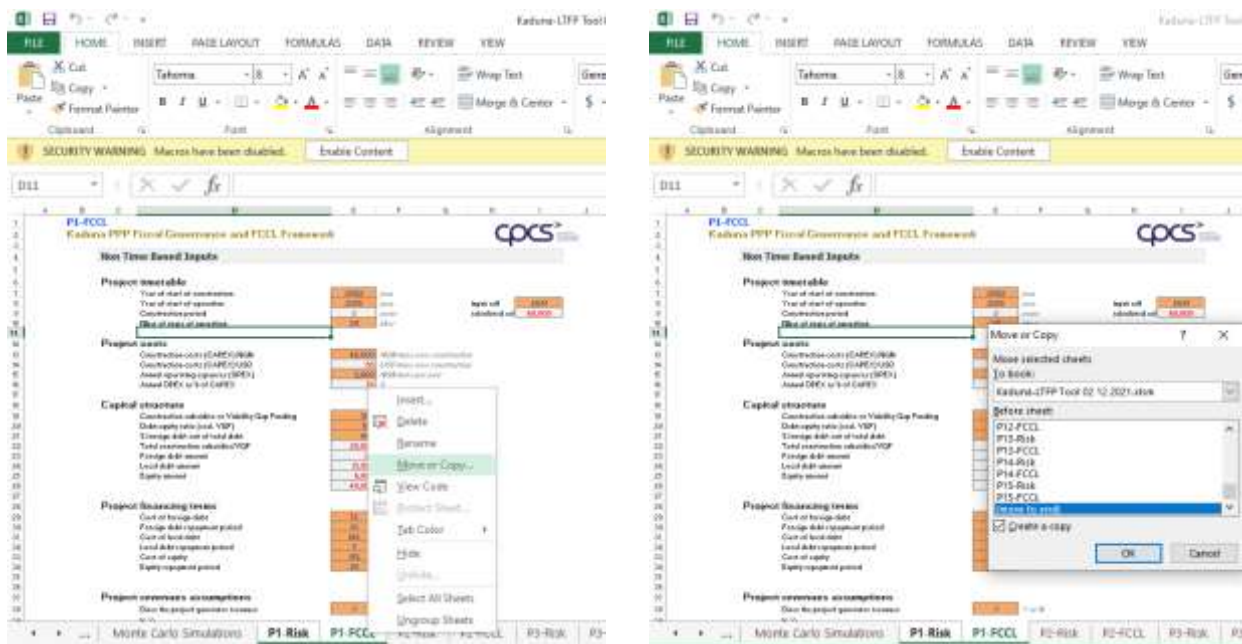

### Adding projects

The step-wise process to add project-based information is summarised below.

**Creating new project sheets:** When analyzing a new project, the user shall select the two project sheets of 'P#-Risk' and 'P#- FCCL' simultaneously and create a copy (as reflected in screenshots below). The worksheet tabs should then be renamed, for example for project number ten, the worksheet tabs would be renamed as 'P10-Risk' and 'P10-FCCL'

**Figure 0-2: Creating new project sheets**

Do

select the ‘P#-Risk’ and ‘P#- FCCL’ simultaneously and create a copy to ensure no programming errors.

- **Project overview in ‘P#-Risk’ sheet:** The user should then input the project assumptions starting with the Project Overview, including the project name, sector, status, and type, as well as the year of assessment.

The Project Overview captures the following information:

**Table 0-2: Project Overview options**

Project Overview	Options
<b>Sectors</b>	<ul style="list-style-type: none"> <li>• Transport</li> <li>• Energy</li> <li>• Water &amp; Sanitation</li> <li>• Agriculture</li> <li>• Education</li> <li>• Health</li> <li>• Housing</li> </ul>

Project Overview	Options
<b>Implementation status</b>	<ul style="list-style-type: none"> <li>• <b>Pipeline:</b> Projects that BPPP has approved as part of the PPP project pipeline, but OBC has not commenced</li> <li>• <b>OBC:</b> projects for which OBC analysis is being undertaken</li> <li>• <b>Procurement:</b> Projects for which the procurement process has commenced based on an approved OBC</li> <li>• <b>FBC:</b> Project for which a private partner has been selected based on an approved Full Business Case (FBC)</li> <li>• <b>Execution:</b> Projects which have an executed PPP agreement, and which are under implementation</li> </ul>
<b>Project Type</b>	<p>The Tool has been structured to facilitate the identification and assessment of FCCL by distinguishing two primary types of PPP based on the revenue source of the private partner:</p> <ul style="list-style-type: none"> <li>• <b>Government Availability Payments (GAP):</b> This is a PPP type in which the Government makes fee payments to the private partner once the project is completed and ready to use. In this case, the CA may offset the direct FC associated with the availability payments with revenue from the project's users.</li> <li>• <b>User's Payments (UP) with the provision of Viability Gap Funding (VGF) and Revenue Guarantee:</b> Under this model, the private partner is reimbursed directly by collecting payment from the project users (as opposed to the Government's payments).</li> </ul> <p>In this case, FC could arise from VGF during construction and operating subsidies during the operational phase.</p> <p>And CLs if the PPP agreement provides for a revenue or volume guarantee. After entering a new project name, sector, and status, the user shall qualify the project type by answering "Y" (yes) or "N" (no) to determine whether the private partner receives availability payments from the Government. This response automatically triggers the corresponding calculation of revenue the private partner earns.</p>

Figure 0-3 This shows an example of a Project Overview for the Bakassi Integrated Deep Seaport Project Restructuring Project, one of the projects used to demonstrate the tool's operation.

**Figure 0-3: Project Overview example from P1-Risk sheet of LTFP Tool**

Figure 1.2: Project Overview (Cross River State Project)

Field	Example Value	Description
Project Name	Bakassi Integrated Deep Seaport Project Restructuring	Name of the project being assessed.
Sector	Transport	The sector to which the project belongs.

Implementation Status	Feasibility Study Completed	Status of project implementation (e.g., planned, in-progress, etc.).
Type of Project	Public-Private Partnership (PPP)	Indicates the type of project (e.g., PPP, BOT, concession).
Year of Assessment	2024	The year for which the FCCL assessment is being conducted.

## Project analysis

- **Project Fiscal Risk Matrix and Register:** The user can then start providing inputs in the Project Fiscal Risk Matrix (PFRM) and Register as described in Section 2.
- **FCCL Register:** The user can populate the project assumptions to calculate FCCL in the “P#-FCCL” sheet, as detailed in Section 3.

### 1.4.4 Aggregation and Overall Impact Assessment

The “Dashboard” sheets aggregate FCCL data and calculate the impact on CRSG finances, following input provided in the “CRSG MacroEco” sheet, as described in Section 4.

### 1.5 Limitation of Tools.

Prior knowledge and understanding of the FCCL Framework are prerequisites for using the LTFP Tool and this Manual. The LTFP Tool simulates the FCCL for CRSG based on inputs provided by the user and relies on the accuracy of the data inputs. The Tool aids in understanding FCCL implications and helping CRSG take mitigation measures.

## 2. Project Risk Assessment

### Fiscal Risk Assessment Methodology

The Technical Guidance of the FCCL Framework details the approach for the fiscal risks assessment for a PPP project. This comprises the following two tasks:

- 1) The development of the PFRM which provides for a qualitative assessment and a prioritisation of the fiscal risks using a project heat map structure. The PFRM supports risk managers in identifying major risks over the project life cycle, their likelihood of materializing, and their fiscal impact. It is based on the PFRAM approach developed by the World Bank and includes mitigation measures to be looked at (refer to Appendix A of the FCCL Framework).
- 2) The development of a Project Fiscal Risk Register (PFRR) to quantify the CL arising from the occurrence of a fiscal risk identified in the PFRM. It is also based on the PFRM and includes the priority risk mitigation actions determined on the project heat map.

The LTFP Tool provides for both PFRM and PFRR templates in the Project Risk Sheet for each PPP project.

#### 2.2 Project Risk Sheet

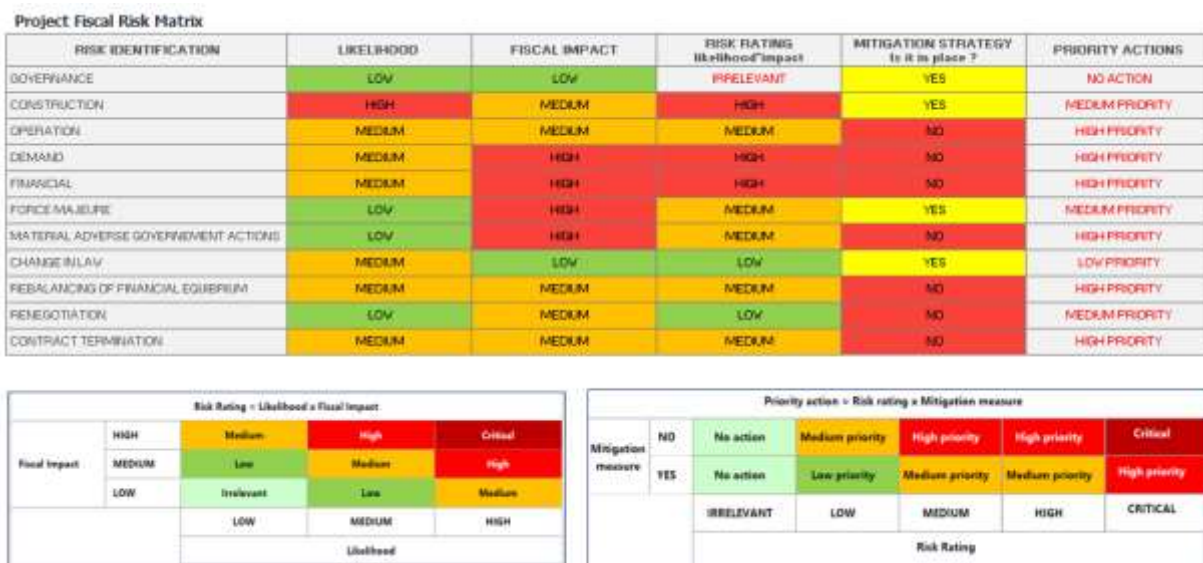

##### 2.2.1 Project Overview

As indicated in Section 0, the Project Risk Sheet (“P#-Risk” sheet) starts with basic information on project name, sector, status, and type which should be filled in first when adding a new project. Refer Figure 0-3: Project Overview example from P1-Risk sheet of LTFP Tool.

##### 2.2.2 PFRM or Project Heat Map

The Project Risk Sheet of the LTFP Tool provides for a pre-formatted PFRM which is generated automatically upon entry of user inputs.

**Figure 0-1: PFRM from LTFP Tool**

The categories of risks are identified in accordance with the PFRAM risk identification (FCCL Framework – Appendix A).

Qualitative assessment of Likelihood and Fiscal Impact are to be entered (Low, Medium or High) as well as whether a mitigation strategy is in place (Yes or No) and the Risk Rating and Priority Actions will automatically filled in.

### 2.2.3 PFRR

Based on the priority actions determined on the project heat map of the PFRM, the user can populate the PFRR, which allows for the further qualification and quantification of fiscal risks in accordance with the FCCL Framework (refer section 3.2.1.2).

**Figure 0-2: PFRR from LTFP Tool**

Project Fiscal Risk Register								
RISK IDENTIFICATION		RISK ALLOCATION	LIKELIHOOD	FISCAL IMPACT	RISK RATINGS		RISK MITIGATION	
Risk category	Event description	Responsible Party	Probability of occurrence	Base costs	Cost of risk materialization - % of Base Costs	Composite of likelihood and impact	Measure	Cost
Severance								
Construction	Biological assets (P)	Government	W	CAPEX	20%	W		
Debt	Shortfall in revenue guarantee (FC)	State	H	REVENUES	% depending on revenue guarantee	See calculation based on ME in the FCCL sheet		See calculation in the FCCL sheet
Foreign	Exchange rate volatility (FC)	Government		FORIGN EXCH	% depending on foreign exchange rate guarantee	See calculation based on ME in the FCCL sheet		See calculation in the FCCL sheet
Force Majeure								
Material adverse government action								
Change in law								
Relinquishing of service application								
Renegotiation								
Cost of termination	Compensation in case of early termination (FC-RT)	State		DEBT-EQUIP	100%	See calculation example in the FCCL sheet		See calculation example in the FCCL sheet

The LTFP specifically provides for calculation of potential CL linked to contract termination, and if relevant, revenue guarantee or foreign exchange rate guarantee in the “P#-FCCL” sheet as detailed in the next section.

### 3 Project FCCL Assessment

#### 3.1 FCCL Assessment Structure

FCCL are assessed in the “P#-FCCL” sheet which is organised in 3 parts:

- 1) **Non-Time-Based-Inputs Section** (rows 4 to 100) where the project assumptions required for the calculation of FCCL are entered.
- 2) **Inputs for and outputs of Monte Carlo simulations** for the purpose of calculating CL in relation to revenue or volume guarantee, and foreign exchange rate guarantee where applicable (rows 100 to 133)
- 3) **Time-Based Outputs** (rows 135 and following) where FCCL are calculated based on the project assumptions and other macro-economic assumptions (provided for in the “CRSGMacroEco” sheet.

All numbers shown in the figures hereafter are illustrative.

#### 3.2 Project Assumptions/ None Time Base Input

The project assumptions can be divided into 2 main parts:

- 1) One which captures the project schedule (construction duration and operation period), costs (capital expenditures and operating expenses), revenues, capital structure and financing terms
- 2) One which relates to FCCL inputs depending on the project type (availability payment or user pay based revenues)

##### 3.2.1 Project schedule and costs

The first input data to be filled in include, the project timetable (start of construction and operation) and project costs (CAPEX and annual OPEX):

###### Project timetable

Year of start of construction	2022	year
Year of start of operation	2025	year
Construction period	3	years
Nber of years of operation	20	nber

###### Project costs

Construction costs (CAPEX) NGN	40 000	NGN mios over construction
Construction costs (CAPEX) USD	98	USD mios over construction
Annual operating expenses (OPEX)	2 000	NGN mios per year
Annual OPEX as % of CAPEX	5%	%

##### 3.2.2 Project capital structure and financing terms

The capital structure assumptions must be filled in next. The Tool captures the following potential sources of financing of project capital expenditures (CAPEX), the values for which are auto-computed as a % of project costs:

- Subsidies during the construction period as % of CAPEX which could be typically required to fill VGF in the case of a user pay based revenue PPP, and trigger direct FC.
- The equity and debt portions in accordance the debt-to-equity ratio, i.e. the percentage of debt financing the CAPEX minus VGF, equity financing the rest.

- Within the debt, the portion which is in USD, potentially triggering CL in case there is a foreign exchange rate guarantee in place.

As can be seen from the Figure below, the model calculates the amounts for government grants, equity in NGN and debt in USD and NGN.

Figure 0-3: Project Assumptions – Capital structure

**Capital structure**

Construction subsidies or Viability Gap Funding	50%	% of CAPEX
Debt:equity ratio (excl. VGF)	70%	%
% foreign debt out of total debt	60%	%
Total construction subsidies/VGF	20 000	NGN mios over construction
Foreign debt amount	20	USD mios
Local debt amount	13 980	NGN mios
Equity amount	6 000	NGN mios
	40 000	CAPEX CHECKING

The terms of project financing for the equity and debt can be input in this section of a “P#-FCCL” sheet, specifically average cost (%) and term (number of years) as shown in the following snapshot

Figure 0-4: Project Assumptions – Financing terms

**Project financing terms**

Cost of foreign debt	7%	%
Foreign debt repayment period	10	nber of years
Cost of local debt	14%	%
Local debt repayment period	5	nber of years
Cost of equity	15%	%
Equity repayment period	20	nber of years

The cost of debt corresponds to the interest rate applied by the lenders whereas the cost of equity is determined by the investors expected return. The equity repayment period is usually the length of operation. These terms are typically extracted from the project financial model developed at the OBC or FBC stage. From these terms, the schedules of each of these financing instruments are auto-calculated in the FCCL sheet. These schedules are used to calculate availability payments (if relevant) and termination compensation as explained further in section 0.

**3.2.3 Project revenues**

The next step is to capture assumptions for the project revenues. This part should be filled in in case of a user pay structure.

### Project revenues assumptions

Does the project generates revenues	Y	Y or N
If, Y:		
Calculated Usage/Output Revenues	Y	Y or N (N if Y to Base Case Revenues - manual entry)
Price of usage or project output	120	NGN per use or project production output
Indexation	CPI	CPI or N
Base Case daily usage/output quantity	77 000	Traffic/Volume/Quantity per day
Usage/output growth	2%	
Days of usage in a year	365	Nber of days
Base Case Revenues - annual, calculated	3 373	NGN mios
or		
Base Case Revenues - manual entry	N	Y or N (N if Y to Calculated usage/output revenues)
Annual amount	3 350	NGN mios
Revenues growth	2%	
Indexation	CPI	CPI or N

- If the project generates revenues from users, the Tool allows for either a calculated revenue based on a price/tariff of usage or project output and a daily volume of usage or production or a manual entry of an annual base case revenue. In both cases, indexation and/or growth rate can be applied.

**Figure 0-5: Project Assumptions – Revenues**

### Project revenues assumptions

Does the project generates revenues	Y	Y or N
If, Y:		
Calculated Usage/Output Revenues	N	Y or N (N if Y to Base Case Revenues - manual entry)
Price of usage or project output	120	NGN per use or project production output
Indexation	CPI	CPI or N
Base Case daily usage/output quantity	77 000	Traffic/Volume/Quantity per day
Usage/output growth	2%	
Days of usage in a year	365	Nber of days
Base Case Revenues - annual, calculated	3 373	NGN mios
or		
Base Case Revenues - manual entry	Y	Y or N (N if Y to Calculated usage/output revenues)
Annual amount	3 350	NGN mios
Revenues growth	2%	
Indexation	CPI	CPI or N

### 3.2.4 Fiscal Commitment Inputs

Once the assumptions on project costs, financing and revenues have been entered, the users can make further choices for FCCL calculation depending on whether the private partner receives availability-based Government payment or is remunerated by the project users.

In case the private partner receives availability payments, these will trigger FC, which can be either calculated by the Tool (based on the coverage of OPEX and financing costs) or entered manually if, for instance, their value is known through the OBC/FBC or PPP agreement. FC could also include construction subsidies if any.

The snapshot below shows the FC inputs part of the non-time based assumptions in the “P#-FCCL” sheet where the choice of calculated or manually entered availability payment is made.

**Figure 0-6: Fiscal Commitments Inputs – Availability payments**

**PPP private contractor revenues**

Government availability payment	Y
Users' payment	N

**Fiscal Commitments Inputs**

***If Government availability payments to PPP Private Contractor***

Construction subsidies	2 000	<i>NGN mios over construction</i>
Availability Payment - manual entry	N	<i>Y or N (Y if the value of annual AP is known)</i>
Annual amount	-	<i>NGN mios</i>
Indexation	CPI	<i>CPI or N</i>
Availability Payment - calculation guidance based on financing costs and OPEX coverage	Y	<i>N if Y to manual entry, Y otherwise</i>

In case the private partner is remunerated by the project revenues, then FC could include VGF during construction and operating subsidies. The latter are entered in this part of the “P#-FCCL” sheet.

**Figure 0-7: Fiscal Commitments Inputs – Operating subsidies**

**PPP private contractor revenues**

Government availability payment	N
Users' payment	Y

**Fiscal Commitments Inputs**

***if Users' payments are revenues to PPP Private Contractor***

Viability Gap Funding	20 000	<i>NGN mios over construction</i>
Operating subsidies	N	<i>Y or N (N if Y to Government availability payment)</i>
Annual amount	0	<i>NGN mios</i>
Indexation	CPI	<i>CPI or N</i>

### 3.2.5 Contingent Liabilities Inputs

Where the private partner is remunerated by users, there could be CL arising from revenue or volume guarantee. If applicable, the user should enter whether the guarantee is based on

- an annual minimum guaranteed revenue (as a % of the base case revenue) or
- A daily minimum volume of usage or output (as a % of the base case daily volume) as shown in the snapshot below.

**Figure 0-8: Contingent Liabilities Inputs – Revenue guarantee scheme**

**PPP private contractor revenues**

Government availability payment	N
Users' payment	Y

**Contingent Liabilities Inputs**

*if Users' payments are revenues to PPP Private Contractor*

Project Revenue Guarantee Scheme	Y
Based on minimum usage/ output volume	N
Guaranteed volume	95%
or	
Based on net revenue guarantee	Y
Guaranteed revenue	95%
Indexation	CPI

In both types of PPP scheme, the LTFP provides for calculation of an exchange rate guarantee. In this section of the “P#-FCCL” sheet, the user is required to enter the portion of the foreign debt for which a foreign exchange rate guarantee has been provided.

**Figure 0-9: Contingent Liabilities Inputs – Foreign exchange rate guarantee**

Finally, systematic and potentially significant CLs arising from PPP come from the possibility of a contract termination before its contractual expiry. In the event of a default by either party to a PPP transaction resulting in its early termination, compensation will usually be due to the private partner/operator in particular if termination is caused by a public sector event of default /breach.

Typically, the termination payments are based on the private partner/operator’s debt liabilities at the time of termination. LTFP allows two type of inputs in relation to potential termination

The time of termination. LTFP allows two type of inputs in relation to potential termination.

- 1) % of debt and equity repaid through compensation in case of early termination (typically 100% in case of termination for public sector default)
- 2) the probability of default, which is entered into the macro-economic sheet of the Tool (“CRSGMacroEco” sheet)

**Figure 0-10: Contingent Liabilities Inputs – Termination payments**

<b>Termination compensation</b>	100%	<i>% of debt repaid through compensation in case of early termination</i>
	120%	<i>% of equity repaid through compensation in case of early termination</i>
<b>Probability of Default Scenario</b>	13,0%	

The quantitative assessment of CLs associated with guarantee schemes or early termination event is presented in Section 3.4.2.

### 3.3 Monte Carlo Simulations

The Tool provides for the calculation of CL in case of revenue or volume guarantee and foreign exchange rate guarantee based on Monte Carlo simulation. MC simulation can also be used for the calculation of revenues forecasts offsetting availability payments. These simulations are contained in the “Monte Carlo Simulations” sheet.

Monte Carlo is a modelling technique consisting in generating random variables on the basis of probability distributions. In the Tool, the random variables generated by the simulations are annual growths (in %) which are applied to initial annual revenue, volume and/or foreign exchange rate to generate forecasted profiles which are then compared with base case profiles to produce adjustment factors.

The Tool includes the flexibility to use three types of probability distributions for each profile: triangular, normal distribution or geometric Brownian motion process.

The choice of distribution types for FCCL assessment is made in the “Monte Carlo Simulations” sheet of the Tool while their parameters for a given project are entered into the “P# FCCL” sheet (rows 102 to 124)

Once the project specific assumptions have been filled in the “P# FCCL” sheet, the CL can be assessed by running Monte Carlo simulations in the “Monte Carlo Simulations” sheet as shown in the snapshot below.

**Figure 0-11: Monte Carlo Simulations – Running instructions**

**Project Details**

Project selector: P5  
 Project name: Student Hostel

**Monte Carlo inputs**

**Project revenues simulations**

*Distribution parameters - Base Guaranteed Revenue*

	Optimistic St.	Base Case	Downside St.	Mean	Std. Dev	Drift	Volatility
Triangle distribution (1)	15%	3%	3%				
Normal distribution (1)				3%	3%		
Geometric Brownian Motion (1)				0,00	1,00	3%	3%

Distribution Selected: Triangle distribution (1)  
 Distribution Selected (number): 1

*Distribution parameters - Market Based Revenues (Usage Volume Based Revenues)*

	Optimistic St.	Base Case	Downside St.	Mean	Std. Dev	Drift	Volatility
Triangle distribution (2)	4%	2%	0%				
Normal distribution (2)				2%	2%		
Geometric Brownian Motion (2)				0,00	1,00	2%	2%

Distribution Selected: Normal distribution (2)  
 Distribution Selected (number): 2

**Foreign exchange rate guarantee**

	Optimistic St.	Base Case	Downside St.	Mean	Std. Dev	Drift	Volatility
Triangle distribution (3)	0%	4%	8%				
Normal distribution (3)				4%	2%		
Geometric Brownian Motion (3)				0,00	1,00	4%	2%

Distribution Selected: Geometric Brownian Motion (3)  
 Distribution Selected (number): 3

**Distribution parameters - Availability Payment Offsets based on Project Revenue Profile**

	Optimistic St.	Base Case	Downside St.	Mean	Std. Dev	Drift	Volatility
Triangle distribution (4)	4%	2%	0%				
Normal distribution (4)				2%	2%		
Geometric Brownian Motion (4)				0,00	1,00	2%	2%

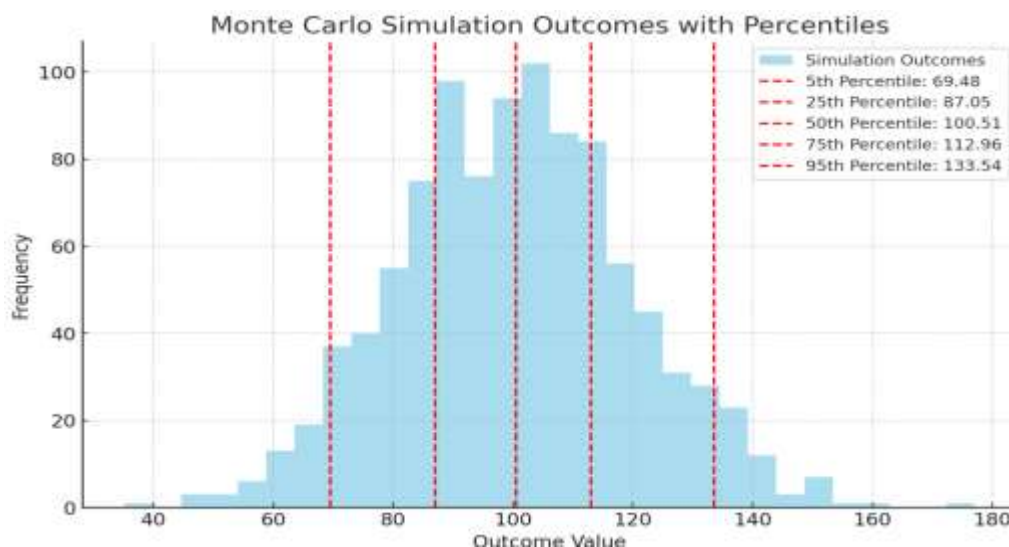

Distribution Selected: Triangle distribution (4)  
 Distribution Selected (number): 1

**Click here to run simulations**

The simulations calculate revenues, volumes or FX rates based on a simulation of annual growth rates (i.e. growth rates are simulated based on a given probability distribution defined by the user). The resulting profile for revenues/volumes/FX rates are then converted into a variation (in % terms) from the base case projections. The Monte Carlo analysis simulates 1,000 simulated profiles based on the probability distribution selected by the user. The simulated profile representing the average cumulative variance is then pasted back into the relevant “P#-FCCL” sheet for the calculation of relevant CL.

To assist the user in understanding what the simulation is doing, the “Monte Carlo Simulations” sheet provides for the graphical presentations of percentiles resulting from the simulation for each simulated variation profiles. An example of such percentile curves based on a triangular distribution is shown in the snapshot below.

**Figure 0-12: Monte Carlo Simulations – Example of percentiles outcome**

Appendix B provides for further explanation on the MC simulation modeling and presentation of available probability distributions including guidance on how to determine their parameters

### 3.4 FCCL Calculations / Time-Based-Outputs

#### 3.4.1 Fiscal commitments

As explained in Section 3.2.4 above, FC calculations depend on the type of PPP project.

For a PPP where the private partner receives **availability payments** from the Government, FC will include these payments, to which could be added some **construction subsidies**, if any.

The Tool provides for the calculation of availability payments based on the coverage of OPEX and financing costs. These financing costs are calculated in the financing instruments schedule provided in the “P#-FCCL” sheet (from row 235 onwards) based on the annuity which should be paid to each instrument provider in accordance with its cost and maturity as entered in the Project assumptions (refer to section 0). It also establishes the annual balance, i.e. the outstanding amount due at the end of each year for each instrument (see figure below). In case of an availability-based PPP, the sum of the annuities forms the part of the availability payments which covers the financing costs. The financing balances constitutes the financial liabilities to be covered by the termination compensation.

## Figure 0-13: Financing instruments schedule

### Financing instruments schedule

Calculation of equity and debt liabilities on the basis of which are calculated termination payments and, where applicable, availability payments.

The user can also choose to enter the availability payment manually.

In case the project generates revenues, it is assumed that they are collected by the Government to help offset the availability payments. The project revenues profile offsetting the availability payments is adjusted using Monte Carlo simulation in order to better assess the actual fiscal impact.

In the “P#-FCCL” sheet, the Tool shows the annual FCs as the sum of construction subsidies and availability payments (either calculated or entered manually) and calculates its NPV. An example of such computation is shown in the figure hereafter.

### 3.4.2 Contingent liabilities

The CL which are calculated based on the project assumptions include:

- Revenue guarantee (either based on a guaranteed amount or a guaranteed market/volume)
- Foreign exchange rate guarantee
- Termination payment

As explained in section 3.3, the CL linked to revenue guarantee or foreign exchange rate guarantee schemes can be calculated based on Monte Carlo Simulations. The running of the integrated macro into the “Monte Carlo Simulations” sheet will automatically generate adjustment factors for each of these guarantee schemes in accordance with project assumptions. However, the user can also manually enter the adjustment factors in the Tool as shown in the snapshot hereafter.

**Figure 0-17: Contingent Liabilities – Adjustment factors for CL calculation linked to guarantee schemes**

<b>Monte Carlo Simulation Outputs</b>					
Base revenue simulation		0%	0%	0%	0%
Market revenue simulation		0%	0%	0%	0%
FX simulation		0%	-2%	-1%	-2%
<b>Manual entry of adjustment factors</b>					
Base revenue simulation		0%	0%	0%	0%
Market revenue simulation		0%	0%	0%	0%
FX simulation		0%	-3%	-2%	0%
<b>Adjustment factors in use</b>		<input type="button" value="Simulation"/>			
Base revenue simulation		0%	0%	0%	0%
Market revenue simulation		0%	0%	0%	0%
FX simulation		0%	-2%	-1%	-2%

#### Revenue guarantee

The CL associated with a revenue guarantee scheme is calculated annually as the difference between the revenue guarantee (based on a monetary amount calculated as a percentage of the base case revenues as part of the CL inputs—cf. section 3.2.5) and the forecasted revenues profile in accordance with the adjustment factors either calculated by a Monte Carlo simulation or entered manually.

#### Market/Volume guarantee

The CL associated with a market or volume guarantee scheme is calculated annually based on the difference between the guaranteed market (based on a daily volume of usage/ project output quantity calculated as a % of the base daily usage/ output volumes as part of the CL inputs – cf. section 3.2.5) and the forecasted market profile under the adjustment factors either calculated by a Monte Carlo

simulation or entered manually. This difference is multiplied by the usage price of usage to obtain a monetary amount.

### Foreign exchange rate guarantee

The CL associated with a foreign exchange rate guarantee scheme is calculated annually as the foreign debt increases in annual cost consequent to the incremental depreciation of the NGN against the USD compared with the base forecasted profile, which assumes purchasing power parity between NGN and USD.

The tool's macroeconomic sheet ("CRSG Macro Eco" sheet) assumes Nigeria and US inflation, and the NGN: USD exchange rate profile is forecasted by purchasing power parity.

**Figure 0-18: Macro-economic assumptions – inflation and foreign exchange rate**

#### Macro-Economic Assumptions for Nigeria

Below are illustrative assumptions for Nigeria's inflation, foreign exchange rate, and purchasing power parity (PPP). These assumptions can be tailored to reflect current and projected economic data.

Indicator	Current Value	Projected Value (1 Year)	Projected Value (5 Years)	Source/Notes
Inflation Rate	18.5%	16.0%	12.0%	Based on Central Bank of Nigeria (CBN) and IMF projections.
Foreign Exchange Rate	₦1700/USD	₦1700/USD	₦950/USD	Reflects trends in managed float policies and market dynamics.
Purchasing Power Parity	₦275/USD (PPP-adjusted)	₦285/USD	₦310/USD	Reflects GDP deflator adjustments and cost of living.

The associated CL is assessed by the annual reporting of the increased debt service payment in NGN consequent to an incremental depreciation of the NGN against the USD. As per the guaranteed schemes, the adjustment factors for the forecasted FX profile can be either generated by Monte Carlo simulation or entered manually.

### Termination payment

Termination payments are calculated annually based on the outstanding balances on the equity and debt instruments multiplied by the percentage of equity and debt covered on termination.

These payments are then weighted by the probability of default rate and the stream of weighted payments discounted at the Nigeria Monetary Policy rate to assess the associated CL. Under this probability adjusted approach for determining termination payments, the minimum discounted value of the weighted annual fees and the overall financing outstanding balance is used as the CL amount for each year.

### Other contingent liabilities

Finally, the Tool allows for the manual entry of other CLs. Those should be identified under the PFRR as detailed in the FCCL guidelines.

The figure below shows an example of typical CL calculation in “P#-FCCL” sheet. For illustration purpose, this example cumulates CL linked to revenues guarantees both based on guaranteed amount and market/volume although in practice there would one or the other or none.

**Figure 0-1: Contingent Liabilities – illustrative example**

<b>CONTINGENT LIABILITIES</b>		Years	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
<b>Revenue guarantee</b>	<input type="checkbox"/>

## 4 Portfolio Database and Impact Assessment

### 4.1 Projects Addition

The Tool initially includes [5] sets of P#-Risk and FCCL sheets with illustrative examples based on preliminary information received on 3 planned PPP projects plus one example of an accommodation PPP.

These illustrative examples are presented in Appendix A.

The Tool provides an additional 10 blank P#-Risk and FCCL sheets. Once a new project is being assessed, these should be populated following the process described in Section 3. The formulae in the dashboard sheets (described below) should also be copied and pasted to ensure that all projects are captured in each calculation block in the dashboards. An example is shown in the figure below.

**Figure 0-1: Extending the dashboard formulae when adding new projects**

### 4.2 CRSG macro-economic assumptions

The Tool includes a sheet titled “CRSG MacroEco” which contains CRSG macro-economic assumptions and forecasts.

Inputs to the “CRSG MacroEco” sheet include inflation, foreign exchange rates, and growth rates for CRSG revenue expenditure, debt, and GDP. Based on these and data provided by BPPP in relation to CRSG budget forecasts over the 2021-2025 period, the sheet calculates CRSG macroeconomic forecasts, as shown in the snapshot below.

**Figure 0-2: CRSG macro-economic forecasts in “CRSG MacroEco” sheet of LTFP Tool**

Year	Inflation Rate	Change Rate	Growth Rate	Revenue Growth	Expenditure Growth	Debt Growth	Debt to GDP	Revenue	Expenditure	CG Debt (USD)	CG GDP (USD)
2024	18.5	770	2.5	8	7.5	5	35	1000	950	2000	5700
2025	16	820	3	8.5	8	5.5	34.5	1080	1020	2100	5900
2026	14.5	860	3.2	9	8.5	6	34	1165	1100	2220	6100
2027	13	900	3.5	9.2	9	6.5	33.5	1250	1200	2350	6300
2028	12	950	3.8	9.5	9.5	6.8	33	1350	1300	2500	6500
2029	11.5	1000	4	10	9.8	7	32.8	1450	1400	2650	6700
2030	11	1050	4.2	10.2	10	7.2	32.5	1550	1500	2800	6900
2031	10.5	1100	4.5	10.5	10.2	7.5	32.2	1650	1600	2950	7100
2032	10	1150	4.7	10.7	10.4	7.7	32	1760	1700	3100	7300
2033	9.5	1200	5	11	10.5	8	31.8	1880	1800	3250	7500

The sources for the above data is as follows:

- GDP/Inflation: SDP 2021 – 2025
- Expenditure: EIU Projections (Elasticity and Moving Averages)
- Total Revenue: SDP 2021 – 2025
- Debt: CRSG Clearing Arrears Framework

These should be updated periodically (to match the CRSG budgeting cycle) or as and when the estimates are updated in the source documents.

### 4.3 Portfolio Dashboards

The Tool provides for 2 Dashboard worksheets which aggregate the results of FCCL calculations on a portfolio basis.

These aggregations are made for:

- 1) Fiscal Commitments
- 2) Contingent Liabilities (excluding termination payments)
- 3) Contingent Liabilities in relation to termination payments

Given that termination event remains unlikely, termination payments CL are separated from guarantees CL to help CL budgeting.

One sheet titled “Dashboard – Annual” aggregate the annual forecasts of FCCL of all projects and assess their impact in % terms and on an annual basis on Government GDP, revenue and public debt.

It also aggregates the results per sector and in accordance with project development status as shown below and provides for visual charts of results as shown in the snapshot below.

**Figure 0-3: Annual Dashboard output examples**

# Appendix A: Project examples in LTFP Tool

## Introduction

### Project Concept Notes Provided by BPPP

As part of the information shared by the Cross River State Bureau of Public Private Partnership (BPPP) to inform the development of the Cross River State Government (CRSG) FCCL Framework, a Project Concept Note (PCN) for each of the three priority projects was provided as follows:

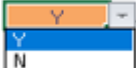

1. Bakassi Integrated Deep Seaport Project Restructuring
2. Marina Resort
3. Obudu Cattle Ranch Resort Cluster

These PCNs provide high-level conceptual information, including some assessments of capital costs and revenue assumptions. This information formed the basis for the datasets used for the “P#-Risk” and “P#-FCCL” sheets examples developed in the Tool.

It should be noted that the level of information provided by the PCNs does not allow for a comprehensive FCCL assessment. Therefore, these examples remain essentially illustrative. Additionally, a purely theoretical PPP accommodation example has been added as Project P4.

This annexure presents further details on these examples, illustrating how the Tool operates depending on the project structure: Government Availability or User’s Payments. It also demonstrates the sequence of actions required to use the Tool based on indicative figures for selected projects, focusing on the Tool’s provisions for the calculations of FCCL

As indicated in Section 1.4.1, all input cells allow numeric inputs and are in orange colour  and users should input data in these cells as per guidance of the indicated units (date, amounts or %) in the adjacent cell. All pre-programmed computed cells are in grey colour . These should not be modified by the user.

All Yes or No cell are equipped with a scroll down  function:

### Sequence of project inputs

The following table summarizes the sequence of tasks for entering project data into the project sheets of the Tool as detailed in Section 3 of this Manual.

Task Number	Task Description	What	Why	Where
1	Input Basic Project Information	Enter the project name, sector, type, implementation status, and year of assessment.	Establish the foundational details of the project for identification and tracking purposes.	"P#-Risk" sheet.
2	Create New Project Sheets	Copy template sheets ("P#-Risk" and "P#-FCCL") and rename them for the new project (e.g., "P10-Risk" and "P10-FCCL").	Ensure a structured and consistent framework for the new project's data entry and analysis.	In the Excel Tool, under the sheet management section.
3	Populate Project-Specific Risk Data	Enter the project's risk matrix, including major risks, their likelihood, and impact.	Identify and assess critical risks to prepare for mitigation strategies.	"P#-Risk" sheet.
4	Enter Assumptions for FCCL Assessment	Provide financial and operational assumptions, such as revenue, cost, and risk parameters.	Enable accurate FCCL calculations and contingent liability assessments.	"P#-FCCL" sheet.
5	Review Pre-Formatted Outputs and Dashboards	Verify computed outputs and visual summaries for accuracy and completeness.	Ensure that the data analysis and outputs align with project expectations and standards.	Corresponding dashboard sheets within the Tool.
6	Finalize Project Data Entry	Cross-check inputs, ensure alignment with FCCL guidelines, and save the changes to the Tool.	Validate all entered data to maintain consistency and reliability in the Tool.	Across all sheets involved in the project data entry process.

## P1 - P1-Risk Sheet

### Project Overview

P1 example is based on preliminary information received on Bakassi Integrated Deep Seaport Project Restructuring.

First step is to fill in the Project Overview information in the Project Risk Sheet including the project payment structure. For the Bakassi Integrated Deep Seaport Project Restructuring, the assumption is that private partner's revenues will be based on users charge. Therefore, selection on the Project type cell to be chosen is "N".

### Project Overview: Bakassi Integrated Deep Seaport Project Restructuring

Field	Details
Project Name	Bakassi Integrated Deep Seaport Project Restructuring
Sector	Transport
Project Status	Feasibility Study Completed
Project Type	Public-Private Partnership (PPP)
Year of Assessment	2024

## P1-FCCL Sheet

### Project Costs and Financing

For FCCL calculations, other project data must be completed in the Project-FCCL sheet in accordance with section 3.2 of the Manual.

For the BRT, the assumptions regarding the project timetable, costs, capital structure and financing terms are as follows:

#### Project timetable

Year of start of construction	2022	year
Year of start of operation	2025	year
Construction period	3	years
Nber of years of operation	20	nber

#### Project costs

Construction costs (CAPEX) NGN	40 000	NGN mios over construction
Construction costs (CAPEX) USD	98	USD mios over construction
Annual operating expenses (OPEX)	2 000	NGN mios per year
Annual OPEX as % of CAPEX	5%	%

#### Capital structure

Construction subsidies or Viability Gap Funding	50%	% of CAPEX
Debt:equity ratio (excl. VGF)	70%	%
% foreign debt out of total debt	60%	%
Total construction subsidies/VGF	20 000	NGN mios over construction
Foreign debt amount	20	USD mios
Local debt amount	13 980	NGN mios
Equity amount	6 000	NGN mios
	40 000	CAPEX CHECKING

#### Project financing terms

Cost of foreign debt	7%	%
Foreign debt repayment period	10	nber of years
Cost of local debt	14%	%
Local debt repayment period	5	nber of years
Cost of equity	15%	%
Equity repayment period	20	nber of years

### Project Revenues

The assumptions on revenues which are to be filled in for user's payment in accordance with instructions given in 3.2.3. For the Bakassi Integrated Deep Seaport Project Restructuring, revenues are calculated based on a manual entry of an annual revenue which is indexed and grows by 2% per year.

#### Project revenues assumptions

Does the project generates revenues	Y	Y or N
If, Y:		
Calculated Usage/Output Revenues	N	Y or N (N if Y to Base Case Revenues - manual entry)
Price of usage or project output	120	NGN per use or project production output
Indexation	CPI	CPI or N
Base Case daily usage/output quantity	77 000	Traffic/Volume/Quantity per day
Usage/output growth	2%	%
Days of usage in a year	365	Nber of days
Base Case Revenues - annual, calculated	3 373	NGN mios
or		
Base Case Revenues - manual entry	Y	Y or N (N if Y to Calculated usage/output revenues)
Annual amount	3 350	NGN mios
Revenues growth	2%	%
Indexation	CPI	CPI or N

### Fiscal Commitments

For users' payment structure, calculated FC can include VGF and operating subsidies as explained in section 3.2.4. For the Bakassi Integrated Deep Seaport Project Restructuring, there

are VGF FC calculated given the assumptions made (50% of CAPEX spread over the 3 year construction period) but no operating subsidy.

**if Users' payments are revenues to PPP Private Contractor**

Viability Gap Funding	20 000	NGN mios over construction
Operating subsidies	N	Y or N (N if Y to Government availability payment)
Annual amount	0	NGN mios
Indexation	CPI	CPI or N

**Contingent Liabilities**

For the Bakassi Integrated Deep Seaport Project Restructuring, the assumptions include a guarantee of 95% Base revenues

**if Users' payments are revenues to PPP Private Contractor**

Project Revenue Guarantee Scheme	Y	Y or N (N if Government Availability Payment)
Based on minimum usage/ output volume	N	Y if Y to Guarantee Scheme and Y to Calculated Usage/Output Revenues, N otherwise
Guaranteed volume	95%	% of Base Case Usage/Volume
or		
Based on net revenue guarantee	Y	Y if Y to Guarantee Scheme and N to based on minimum usage/output volume
Guaranteed revenue	95%	% of Base Case Revenues based on manual entry
Indexation	CPI	CPI or N

This guarantee triggers a CL which is calculated through MC simulations in the Monte Carlo Simulations sheet assuming a triangular distribution for the adjustment factor profile based on which forecasted revenues are calculated.

It is further assumed in the Bakassi Integrated Deep Seaport Project Restructuring example that there is a foreign exchange guarantee (on 100% of the foreign debt), which triggers a CL calculated through MC simulations in the Monte Carlo Simulations sheet.

<b>Foreign exchange rate guarantee</b>	100	% of foreign debt the exchange rate of which is guaranteed by the State
--	-----	---

CL linked to early termination risk is calculated as explained in section 3.4.2.

For the purpose of illustration, an additional CL based on 3% of CAPEX has been included during construction for geological risk.

<b>Other contingent liabilities</b>					
To be entered manually with reference to PFRR	NGN mios	0	0	0	0
<b>Ex - Geological Risk triggers CL equal to 3% of CAPEX</b>	NGN mios	2%	0	800	800

**P2 – Marina Resort Project  
P2 Risk Sheet**

**Project Overview**

P2 example is based on preliminary information received on the Marina Resort Project.

The first step is to fill in the Project Overview information in the Project Risk Sheet, including the project payment structure. For the Marina Resort Project, the assumption is that private

partners will receive payments based on a take or pay agreement, which is similar to Availability Payments. Therefore, selection on the Project type cell to be chosen is “Y”.

#### Project Overview

Project Name	Renewable	
Sector	Energy	Transport, Energy, Water & Sanitation, Agriculture, Education, Health, Housing
Project Status	Pipeline	Pipeline/OBC/Procurement/FBC/Execution
Project type	Y	Government Availability Payments
	N	Users' Payments associated with VGF and/or Revenue Guarantee
Year of assessment	2021	year

## P2-FCCL Sheet

### Project Costs and Financing

Other project data must be completed in the Project-FCCL sheet in accordance with section 3.2 of the Manual for FCCL calculations.

For the Marina Resort Project, the assumptions regarding the project timetable, costs, capital structure, and financing terms are as follows:

#### Project timetable

Year of start of construction	2022	year
Year of start of operation	2025	year
Construction period	3	years
Nber of years of operation	20	nber

#### Project costs

Construction costs (CAPEX) NGN	45 000	NGN/mios over construction
Construction costs (CAPEX) USD	110	USD/mios over construction
Annual operating expenses (OPEX)	2 000	NGN/mios per year
Annual OPEX as % of CAPEX	4%	%

#### Capital structure

Construction subsidies or Viability Gap Funding	50%	% of CAPEX
Debt:equity ratio (excl. VGF)	70%	%
% foreign debt out of total debt	60%	%
Total construction subsidies/VGF	22 500	NGN/mios over construction
Foreign debt amount	23	USD/mios
Local debt amount	15 727	NGN/mios
Equity amount	6 750	NGN/mios
	45 000	CAPEX CHECKING

#### Project financing terms

Cost of foreign debt	7%	%
Foreign debt repayment period	10	nber of years
Cost of local debt	14%	%
Local debt repayment period	5	nber of years
Cost of equity	15%	%
Equity repayment period	20	nber of years

## Project Revenues

A project based on an availability payment structure can also generate revenues which will offset availability payments. In this case, there are no other revenues than the payments made by the public authority for the electricity produced.

#### Project revenues assumptions

Does the project generates revenues	N	Y or N
-------------------------------------	---	--------

## Fiscal Commitments

For an availability payment structure, the calculated FC can include Construction Subsidies, if any, and shall include availability payments according to the assumptions presented in section 3.2.4. For the Marina Resort project, FC is calculated in relation to Construction Subsidies given the assumptions made (50% of CAPEX spread over the 3-year construction period).

FC arising from availability payments are calculated based on financing costs and OPEX coverage.

### *If Government availability payments to PPP Private Contractor*

Construction subsidies	<input type="text" value="22500"/>	<i>NGN mios over construction</i>
Availability Payment - manual entry	<input type="text" value="N"/>	<i>Y or N (Y if the value of annual Availability Payment is known through OBC or Project Agreement)</i>
Annual amount	<input type="text" value="-"/>	<i>NGN mios</i>
Indexation	<input type="text" value="CPI"/>	<i>CPI or N</i>
Availability Payment - calculation guidance based on financing costs and OPEX coverage	<input type="text" value="Y"/>	<i>N if Y to manual entry, Y otherwise</i>

## Contingent Liabilities

There are no revenue or demand guarantees for an availability-based project. In the Renewable case, an FX guarantee is assumed, which triggers a CL calculation through MC simulations in the Monte Carlo Simulations sheet.

Foreign exchange rate guarantee	<input type="text" value="100"/>	<i>% of foreign debt the exchange rate of which is guaranteed by the State</i>
---------------------------------	----------------------------------	--

A CL linked to early termination risk is calculated as explained in section 3.4.2.

For the purpose of illustration, an additional CL has been included during construction for land acquisition risk based on 2% of CAPEX.

<b>Other contingent liabilities</b>	To be entered manually with reference to PFRR	<i>NGN mios</i>	<input type="text" value="0"/>	<input type="text" value="0"/>	<input type="text" value="0"/>	<input type="text" value="0"/>	
<b>Ex - Land acquisition triggers CL equal to 2% of CAPEX</b>		<i>NGN mios</i>	<input type="text" value="2%"/>	<input type="text" value="0"/>	<input type="text" value="900"/>	<input type="text" value="900"/>	<input type="text" value="900"/>

## P3 - Obudu Cattle Ranch Resort Cluster

### P3-Risk Sheet

#### Project Overview

The P3 example is based on preliminary information received on the Obudu Cattle Ranch Resort Cluster Project.

For this project, the assumption is that the private partner's revenues will be based on the Services charged by hoteliers, cable cars, air fares, tour guides, etc. by the centres. Therefore, Project type selection is "N" on the P3-Risk Sheet.

## Project Overview

Project Name	Grains aggregation	
Sector	Agriculture	Transport, Energy, Water & Sanitation, Agriculture, Education, Health, Housing
Project Status	OBC	Pipeline/OBC/Procurement/FBC/Execution
Project type	N	Government Availability Payments
	Y	Users' Payments associated with VGF and/or Revenue Guarantee
Year of assessment	2021	year

## P3-FCCL Sheet

### Project Costs and Financing

For the Obudu Cattle Ranch Resort Cluster Project, the assumptions regarding the project timetable, costs, capital structure and financing terms are as follows:

#### Project timetable

Year of start of construction	2022	year
Year of start of operation	2025	year
Construction period	3	years
Nber of years of operation	20	nber

#### Project costs

Construction costs (CAPEX) NGN	1000	NGN mios over construction
Construction costs (CAPEX) USD	2	USD mios over construction
Annual operating expenses (OPEX)	50	NGN mios per year
Annual OPEX as % of CAPEX	5%	%

#### Capital structure

Construction subsidies or Viability Gap Funding	0%	% of CAPEX
Debt:equity ratio (excl. VGF)	70%	%
% foreign debt out of total debt	30%	%
Total construction subsidies/VGF	0	NGN mios over construction
Foreign debt amount	1	USD mios
Local debt amount	700	NGN mios
Equity amount	300	NGN mios
	1000	CAPEX CHECKING

#### Project financing terms

Cost of foreign debt	7%	%
Foreign debt repayment period	10	nber of years
Cost of local debt	14%	%
Local debt repayment period	5	nber of years
Cost of equity	15%	%
Equity repayment period	20	nber of years

### Project Revenues

In this case, revenues are calculated based on the daily output of the centres in accordance with PCN and illustrative assumption made on price per T.

## Project revenues assumptions

Does the project generates revenues	<input type="text" value="Y"/>	<i>Y or N</i>
If, Y:		
Calculated Usage/Output Revenues	<input type="text" value="Y"/>	<i>Y or N (N if Y to Base Case Revenues - manual entry)</i>
Price of usage or project output	<input type="text" value="20"/>	<i>NGN/per use or project production output</i>
Indexation	<input type="text" value="CPI"/>	<i>CPI or N</i>
Base Case daily usage/output quantity	<input type="text" value="45 000"/>	<i>Traffic/Volume/Quantity per day</i>
Usage/output growth	<input type="text" value="2%"/>	
Days of usage in a year	<input type="text" value="365"/>	<i>Nber of days</i>
Base Case Revenues - annual, calculated	<input type="text" value="329"/>	<i>NGN/mios</i>
or		
Base Case Revenues - manual entry	<input type="text" value="N"/>	<i>Y or N (N if Y to Calculated usage/output revenues)</i>
Annual amount	<input type="text" value="0"/>	<i>NGN/mios</i>
Revenues growth	<input type="text" value="2%"/>	
Indexation	<input type="text" value="CPI"/>	<i>CPI or N</i>

## Fiscal Commitments

Calculated FC can include VGF and operating subsidies given the type of payment structure. None have been assumed for the Obudu Cattle Ranch Resort Cluster Project.

### *if Users' payments are revenues to PPP Private Contractor*

Viability Gap Funding	<input type="text" value="0"/>	<i>NGN/mios over construction</i>
Operating subsidies	<input type="text" value="N"/>	<i>Y or N (N if Y to Government availability payment)</i>
Annual amount	<input type="text" value="0"/>	<i>NGN/mios</i>
Indexation	<input type="text" value="CPI"/>	<i>CPI or N</i>

## Contingent Liabilities

For the Obudu Cattle Ranch Resort Cluster, the assumptions include a guarantee of 95% daily output offtake.

### *if Users' payments are revenues to PPP Private Contractor*

Project Revenue Guarantee Scheme	<input type="text" value="Y"/>	<i>Y or N (N if Government Availability Payment)</i>
Based on minimum usage/ output volume	<input type="text" value="Y"/>	<i>Y if Y to Guarantee Scheme and Y to Calculated Usage/Output Revenues, N otherwise</i>
Guaranteed volume	<input type="text" value="95%"/>	<i>% of Base Case Usage/Volume</i>
or		
Based on net revenue guarantee	<input type="text" value="N"/>	<i>Y if Y to Guarantee Scheme and N to based on minimum usage/output volume</i>
Guaranteed revenue	<input type="text" value="100%"/>	<i>% of Base Case Revenues based on manual entry</i>
Indexation	<input type="text" value="CPI"/>	<i>CPI or N</i>

This market-based guarantee triggers a CL which, in this case, for illustration purpose, is calculated based on a manually entered adjustment factor.

### *Adjustment factors in use*

<input type="text" value="Manual"/>
Base Guaranteed Revenue
Market Based Revenues (Usage Volume Based Revenues)
Foreign Exchange

It is further assumed in the Obudu Cattle Ranch Resort Cluster example that there is a foreign exchange guarantee (on 100% of the foreign debt), which triggers a CL calculated through MC simulations in the Monte Carlo Simulations sheet.

**Foreign exchange rate guarantee**

100 % of foreign debt the exchange rate of which is guaranteed by the State

A CL linked to early termination risk is calculated as explained in section 3.4.2

## P4 – Calabar Fishing & Processing Facility

### P4-Risk Sheet

#### Project Overview

P4 example is based on preliminary information received on the Calabar Fishing & Processing Facility Project.

For this project, the assumption is that the private partner’s revenues will be based on payments received by the Consumers. Therefore, the Project type selection is “N” on the P4-Risk Sheet.

#### Project Overview

Project Name	Agro processing	
Sector	Agriculture	Transport, Energy, Water & Sanitation, Agriculture, Education, Health, Housing
Project Status	OBC	Pipeline/OBC/Procurement/FBC/Execution
Project type	N	Government Availability Payments
	Y	Users' Payments associated with VGF and/or Revenue Guarantee
Year of assessment	2021	year

### P4-FCCL Sheet

#### Project Costs and Financing

For this project, the assumptions regarding the project timetable, costs, capital structure, and financing terms are as follows:

#### Project timetable

Year of start of construction	2022	year
Year of start of operation	2025	year
Construction period	3	years
Nber of years of operation	20	nber

#### Project costs

Construction costs (CAPEX) NGN	100 000	NGN mios over construction
Construction costs (CAPEX) USD	244	USD mios over construction
Annual operating expenses (OPEX)	10 000	NGN mios per year
Annual OPEX as % of CAPEX	10%	%

#### Capital structure

Construction subsidies or Viability Gap Funding	20%	% of CAPEX
Debt:equity ratio (excl. VGF)	70%	%
% foreign debt out of total debt	50%	%
Total construction subsidies/VGF	20 000	NGN mios over construction
Foreign debt amount	68	USD mios
Local debt amount	55 332	NGN mios
Equity amount	24 000	NGN mios
	100 000	CAPEX CHECKING

## Project Revenues

In this case, revenues are calculated based on a manual entry for initial annual revenue to which is applied a growth rate (2%) and inflation (CPI).

### Project revenues assumptions

Does the project generates revenues	Y	Y or N
If, Y:		
Calculated Usage/Output Revenues	N	Y or N (N if Y to Base Case Revenues - manual entry)
Price of usage or project output	150	NGN per use or project production output
Indexation	CPI	CPI or N
Base Case daily usage/output quantity	500	Traffic/Volume/Quantity per day
Usage/output growth	2%	
Days of usage in a year	365	Nber of days
Base Case Revenues - annual, calculated	27	NGN mios
or		
Base Case Revenues - manual entry	Y	Y or N (N if Y to Calculated usage/output revenues)
Annual amount	10 000	NGN mios
Revenues growth	2%	
Indexation	CPI	CPI or N

## Fiscal Commitments

Calculated FC can include VGF and operating subsidies given the type of payment structure. For this example, VGF FC is calculated given the assumptions made (20% of CAPEX spread over the 3-year construction period) but no operating subsidies.

### *if Users' payments are revenues to PPP Private Contractor*

Viability Gap Funding	20 000	NGN mios over construction
Operating subsidies	N	Y or N (N if Y to Government availability payment)
Annual amount	0	NGN mios
Indexation	CPI	CPI or N

## Contingent Liabilities

For this project, the assumptions include a guarantee of 95% Base revenues.

### *if Users' payments are revenues to PPP Private Contractor*

Project Revenue Guarantee Scheme	Y	Y or N (N if Government Availability Payment)
Based on minimum usage/output volume	N	Y if Y to Guarantee Scheme and Y to Calculated Usage/Output Revenues, N otherwise
Guaranteed volume	95%	% of Base Case Usage/Volume
or		
Based on net revenue guarantee	Y	Y if Y to Guarantee Scheme and N to based on minimum usage/output volume
Guaranteed revenue	95%	% of Base Case Revenues based on manual entry
Indexation	CPI	CPI or N

This guarantee triggers a CL calculated through MC simulations in the Monte Carlo Simulations sheet assuming a normal distribution for the adjustment factor profile based on which forecasted volumes are calculated.

In this example, a foreign exchange guarantee (on 100% of the foreign debt) is further assumed, which triggers a CL calculated through MC simulations in the Monte Carlo Simulations sheet.

**Foreign exchange rate guarantee**

**100** % of foreign debt the exchange rate of which is guaranteed by the State

A CL linked to early termination risk is calculated as explained in section 3.4.2.

## P5 – State-wide Housing Scheme

P5 sheets present a theoretical example of an availability-based payment structure including project revenue. This could apply for instance to a housing accommodation developed on a PPP basis where the private partner receives availability payments from the public authority whereas this public authority collects rent or outright purchase payment from the occupiers.

### P5-Risk Sheet

#### Project Overview

Project type selection is “Y” on the P5-Risk Sheet.

Year	NGN m/yr	NGN m/yr	NGN m/yr	to GDP	Revenue	expenditure	G Debt	USG GDP (USD)
2024	8	7.5	5	35	1000	950	2000	5700
2025	8.5	8	5.5	34.5	1080	1020	2100	5900
2026	9	8.5	6	34	1165	1100	2220	6100
2027	9.2	9	6.5	33.5	1250	1200	2350	6300
2028	9.5	9.5	6.8	33	1350	1300	2500	6500
2029	10	9.8	7	32.8	1450	1400	2650	6700
2030	10.2	10	7.2	32.5	1550	1500	2800	6900
2031	10.5	10.2	7.5	32.2	1650	1600	2950	7100
2032	10.7	10.4	7.7	32	1760	1700	3100	7300
2033	11	10.5	8	31.8	1880	1800	3250	7500

### P5-FCCL Sheet

#### Project Costs and Financing

Theoretical assumptions regarding the project timetable, costs, capital structure and financing terms are as follows:

##### Project timetable

Year of start of construction  
Year of start of operation  
Construction period  
Nber of years of operation

2022	year
2025	year
3	years
20	nber

##### Project costs

Construction costs (CAPEX) NGN  
Construction costs (CAPEX) USD  
Annual operating expenses (OPEX)  
Annual OPEX as % of CAPEX

10 000	NGN mios over construction
24	USD mios over construction
500	NGN mios per year
5%	%

##### Capital structure

Construction subsidies or Viability Gap Funding  
Debt:equity ratio (excl. VGF)  
% foreign debt out of total debt  
Total construction subsidies/VGF  
Foreign debt amount  
Local debt amount  
Equity amount

20%	% of CAPEX
70%	%
50%	%
2 000	NGN mios over construction
7	USD mios
5 593	NGN mios
2 400	NGN mios
10 000	CAPEX CHECKING

##### Project financing terms

Cost of foreign debt  
Foreign debt repayment period  
Cost of local debt  
Local debt repayment period  
Cost of equity  
Equity repayment period

7%	%
10	nber of years
14%	%
5	nber of years
15%	%
20	nber of years

## Project Revenues

Rent or outright purchase collected by the public authority, and off-setting of the availability payment, are calculated based on usage and tariff assumptions.

### Project revenues assumptions

Does the project generates revenues	<input checked="" type="checkbox"/> Y	Y or N
If, Y:		
Calculated Usage/Output Revenues	<input checked="" type="checkbox"/> Y	Y or N (N if Y to Base Case Revenues - manual entry)
Price of usage or project output	150	NGN per use or project production output
Indexation	CPI	CPI or N
Base Case daily usage/output quantity	500	Traffic/Volume/Quantity per day
Usage/output growth	2%	
Days of usage in a year	365	Nber of days
Base Case Revenues - annual, calculated	27	NGN mios
or		
Base Case Revenues - manual entry	<input checked="" type="checkbox"/> N	Y or N (N if Y to Calculated usage/output revenues)
Annual amount	0	NGN mios
Revenues growth	2%	
Indexation	CPI	CPI or N

## Fiscal Commitments

In this theoretical case, FC include Construction Subsidies (20% of CAPEX spread over the 3 year construction period). FC arising from availability payment are calculated based on financing costs and OPEX coverage and offset by project revenues adjusted using MC simulations

FISCAL COMMITMENTS		Years	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
<i>If Government availability payment to PPP Private Contractor</i>												
Construction subsidies			0	667	667	667	0	0	0	0	0	0
Availability Payments - manual entry	<input checked="" type="checkbox"/> N		0	0	0	0	0	0	0	0	0	0
Availability Payments - guidance calculation	<input checked="" type="checkbox"/> Y											
Availability Payments covering financing	AGN/mios		0	0	0	0	2,479	2,479	2,511	2,531	2,569	261
Availability Payments covering OPEX	AGN/mios		0	0	0	0	655	701	750	801	854	919
Total Availability Payments	AGN/mios		0	0	0	0	3,134	3,180	3,261	3,340	3,417	1,180
Project Revenues - Availability Payments Offsets	<input checked="" type="checkbox"/> Y

## Appendix B Monte Carlo simulations and probability distributions

### Monte Carlo Simulations

As indicated in section 3.3, Monte Carlo simulation is a modelling technique consisting in generating random variables on the basis of probability distributions. The Tool includes the flexibility to run MC simulations using three types of distributions:

- a triangular distribution;
- a normal distribution; and
- a geometric Brownian motion process.

The MC simulation in the Tool consists in calculating 1,000 annual growth rate profiles from 1,000 random probability draws based on one of the available distributions.

The average of the 1,000 calculated growth rates profiles (based on random probabilities draws and a given distribution) is then used as the annual growth rate forecast for 4 different streams of figures, when relevant depending on the project structure and assumptions:

- guaranteed revenue or guaranteed volume for users' payment structure;
- revenue forecast offsetting availability payment in the AP structure;
- FX rate in case of FX rate guarantee.

Each forecast profile is derived from the annual growth rates established by the MC simulation and a first-year value based on the project assumptions. It is then compared with the base case assumptions to arrive at the adjustment factors used for assessing the associated Contingent Liability.

Before running a MC simulation on a given profile, the user must choose between the 3 types of probability distributions and fill in their parameters.

#### Project revenues simulations

##### Distribution parameters - Base Guaranteed Revenue

	Optimistic Sc.	Base Case	Downside Sc.	Mean	Std. Dev.	Drift	Volatility
Triangle distribution (1)	15%	3%	3%				
Normal distribution (1)				3%	3%		
Geometric Brownian Motion (1)				0,00	1,00	3%	3%
Distribution Selected	Triangle distribution (1)						
Distribution Selected (number)	1						

##### Distribution parameters - Market Based Revenues (Usage Volume Based Revenues)

	Optimistic Sc.	Base Case	Downside Sc.	Mean	Std. Dev.	Drift	Volatility
Triangle distribution (2)	4%	2%	0%				
Normal distribution (2)				2%	2%		
Geometric Brownian Motion (2)				0,00	1,00	2%	2%
Distribution Selected	Normal distribution (2)						
Distribution Selected (number)	2						

#### Foreign exchange rate guarantee

	Optimistic Sc.	Base Case	Downside Sc.	Mean	Std. Dev.	Drift	Volatility
Triangle distribution (3)	0%	4%	8%				
Normal distribution (3)				4%	2%		
Geometric Brownian Motion (3)				0,00	1,00	4%	2%
Distribution Selected	Geometric Brownian Motion (3)						
Distribution Selected (number)	3						

#### Distribution parameters - Availability Payment Offsets based on Project Revenue Profile

	Optimistic Sc.	Base Case	Downside Sc.	Mean	Std. Dev.	Drift	Volatility
Triangle distribution (4)	4%	2%	0%				
Normal distribution (4)				2%	2%		
Geometric Brownian Motion (4)				0,00	1,00	2%	2%
Distribution Selected	Triangle distribution (4)						
Distribution Selected (number)	1						

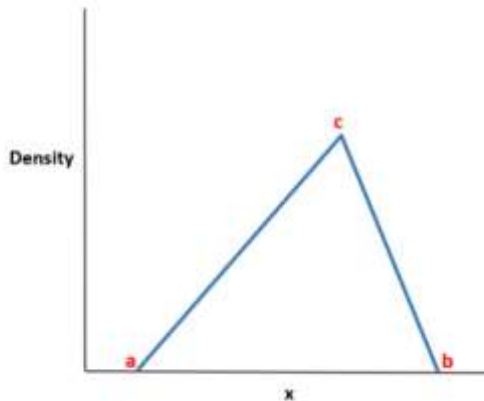

The purpose of this Appendix is to present the available probability distributions and provide guidance on how to determine their parameters.

## Triangular distribution

The triangular distribution is a continuous probability distribution with a probability density function shaped like a triangle. It is defined by three values:

1. The minimum value a
2. The maximum value b
3. The peak value c

The name of the distribution comes from the fact that the probability density function is shaped like a triangle, as shown in the figure below.

This distribution is especially relevant when we can estimate the minimum value a, the maximum value b, and the most likely value c that a random variable will take on, so we can model the behavior of random variables by using a triangular distribution with the knowledge of just these three values.

In the Tool, these values are named as follows:

- a: Pessimistic Scenario
- b: Optimistic scenario
- c: Base Case

The values of a, b, and c represent growth rates for the given variable of interest. For example, if the user inputs a value of 2% for the Base Case (a) assumption for the availability payments, this would imply a base case assumption of 2% annual growth.

To calculate the growth rate (X) in given year, the model uses a formula derived from the cumulative distribution function (CDF). For a given draw of a random variate (U) from a uniform distribution in the interval (0,1) (derived using the “RAND()” function in Excel), the formula for calculating the annual growth rate is as below. This calculation is done independently for each year.

$$X = \begin{cases} a + \sqrt{U * (b - a) * (c - a)}, & \text{for } 0 < U < \frac{c - a}{b - a} \\ b - \sqrt{(1 - U) * (b - a) * (b - c)}, & \text{for } \frac{c - a}{b - a} < U < 1 \end{cases}$$

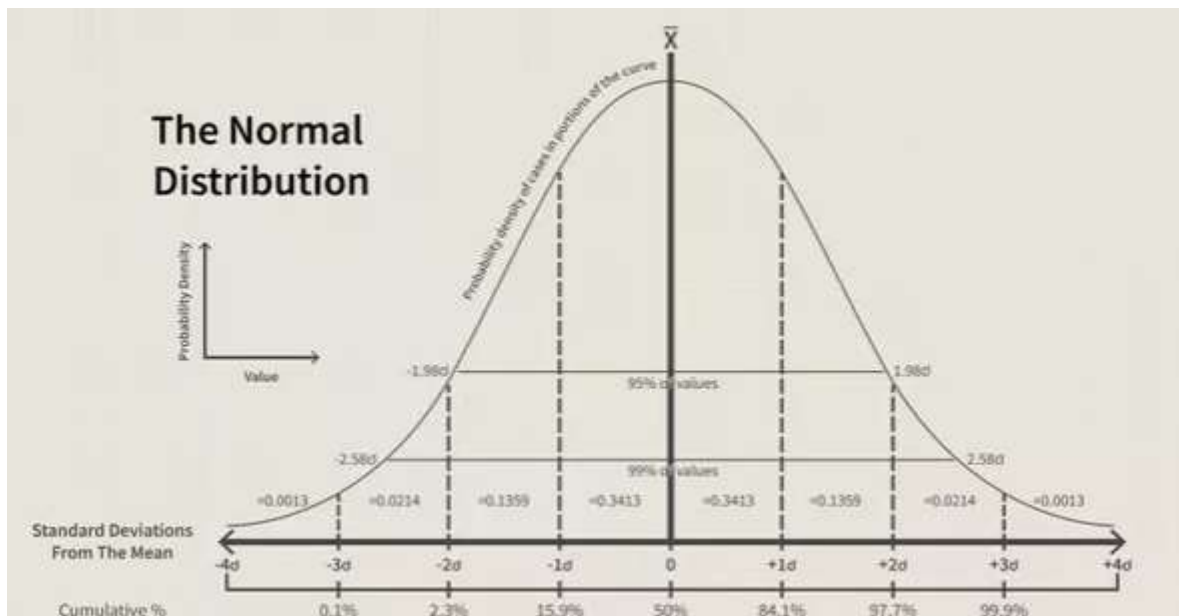

Typically for revenue growth simulation, the variable a will be the base case assumption (for instance CPI + Base case growth), b the best case growth anticipation and c the worst case one.

### Normal distribution

Normal distribution, also known as the Gaussian distribution, is a probability distribution that is symmetric about the mean, showing that data near the mean are more frequent in occurrence than data far from the mean. In graph form, normal distribution will appear as a bell curve (as shown in the figure below).

The normal distribution is the most common type of distribution assumed in statistical analyses. The standard normal distribution has two parameters: the mean  $\mu$  and the standard deviation  $\sigma$ .

For a normal distribution, 68% of the observations are within +/- one standard deviation of the mean, 95% are within +/- two standard deviations, and 99.7% are within +/- three standard deviations.

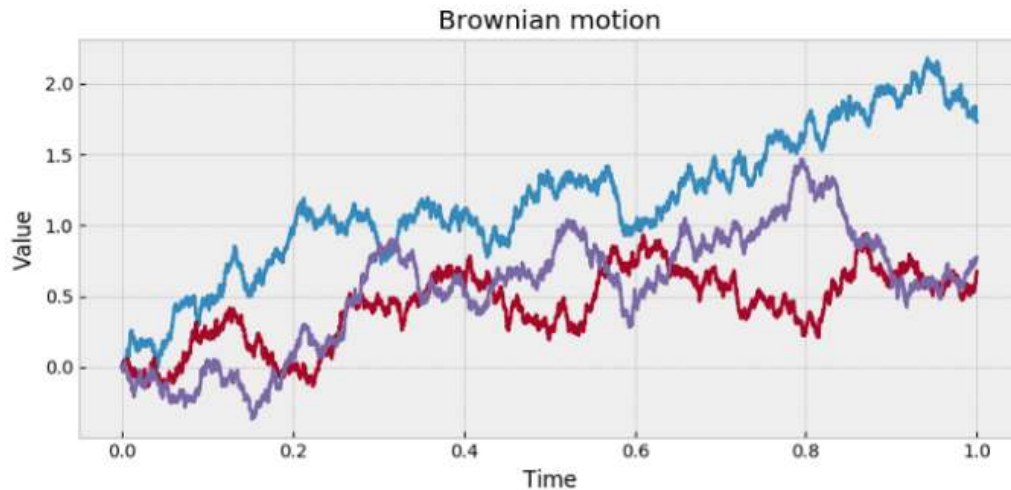

The tool uses the Excel formula NORM to calculate growth rates based on the normal distribution. NV returns, for a given probability (selected using the RAND() function), the value of a random variable following a normal distribution for the mean and the specified standard deviation. In other words, it is the inverse of the CDF for a normal distribution.

Typically, the mean will be the base case growth rate when using the normal distribution. For example, volume growth guarantees an anticipated market growth of 2%. The choice of SD will be based on the expected variation around this base case growth.

### Geometric Brownian Motion

A geometric Brownian motion (GBM) is a continuous-time stochastic process in which the logarithm of the randomly varying quantity follows a Brownian motion with drift.

GBM is a typical example of stochastic processes. A stochastic process is a collection of random variables: a variable  $x$  at time  $t$  is a random variable, i.e. the outcome of a hypothetical random

Experiment, then a collection of these outcomes, for each time period  $t$ , gives us a stochastic process.

Stochastic process such as GBM are often used in finance, in particular for establishing stock prices forecasts.

At a given year ( $t$ ) the growth rate ( $g(t)$ ), when a GBM is assumed, is calculated using the following formula:

$$g(t) = e^{\left(\mu - \frac{\sigma^2}{2}\right)t + \sigma Z} - 1$$

Where:

- $\mu$  = drift
- $\sigma$  = volatility
- $z$  = normally distributed random variable with mean 0 and variance 1 based on the probability draw in year  $t$  (calculated using the NORM.INV and RAND () Excel functions, as discussed in the previous section).

The drift  $\mu$  corresponds to the base case growth. The volatility  $\delta$  translates the anticipated variation around the base case growth. This is the same calibration as discussed in the previous section.

Based on its typical use in the financial markets, the GBM can typically be chosen for the MC simulation for the calculation of CL related to FX guarantee
